

The efficient all-in-one filtration system

CTO+ ceramic filter consists of two important elements.

The porous ceramic outer-layer contains millions of tiny holes - it also contains silver. The holes are so small that bugs and particles are blocked on the ceramic surface but allow water to pass through. Bugs trapped on the surface are killed by the silver which stops them from breeding.

After time particles may block the holes, reducing the flow. Coldstream ceramic filters are easy to clean by simply rubbing them with the scouring pads provided to remove the particles and restore the flow.

The second, inner core element is made from a specially modified carbon block. It removes chlorine, chemicals and metals, especially lead and mercury, allowing only healthy salts and electrolytes through. This produces safe, clear water that tastes good too - straight from your tap.

PS - Scouring pads are not included with the filter - A normal kitchen scourer will do the job
